

CSO / Diabetes

Case Region of Southern Denmark, Hospital of Southern Jutland
Denmark

Challenge

Hospital of Southern Jutland needed to improve the effectiveness of their Diabetes Outpatient Clinics in order to increase the number of cases treated. They also had to reduce the average of 15 minutes spent on processing and sending patient records to the NIP (National Indicator Project which measures the quality of care provided by the hospitals to groups of patients with specific medical conditions). Furthermore, the hospital had to meet the regional requirements stating that 90% of the diabetes patients' records should be reported to NIP.

Results with CSO/Diabetes

Since implementing CSO/Diabetes the hospital's Diabetes Outpatient Clinics have increased their income by improving their efficiency and treat more patients through the system while maintaining a high quality of care. The time spent reporting to NIP has decreased from 15 minutes per patient to less than 5 minutes. Furthermore Hospital of Southern Jutland now meets Region of Southern Denmark's requirements of reporting 90% of their diabetes patients' records to NIP (National Indicator Project).

Medical Director, Henrik Villadsen, Hospital of Southern Jutland

There are two major advantages with the CSO/Diabetes system. First of all the system supports event based high quality vital signs and that is a growing

demand from our surroundings. Second of all the system reports patient records automatically to NIP. Both things contribute to a decrease of the Outpatient Clinics workload and at the same time help to improve the quality in the patient treatment.

Since we started using CSO/Diabetes we have achieved a smooth and streamlined workflow in our Outpatient Clinics because all our treatment teams have access to real time information about the current condition of patients.
